

Standing Order Callback API Documentation

1. Introduction

This document defines the API specification for receiving **Standing Order Setup Callbacks** from partners. The callback informs NSSF whether the standing order setup request was successfully processed on the partner's side.

2. Background

To establish automated periodic contributions, NSSF sends standing order setup instructions to financial partners (banks, telecoms, etc.). After processing, the partner must send a callback to confirm success or failure. This ensures synchronization between the partner's system and NSSF's system.

3. Purpose

- Confirm receipt of standing order setup results from the partner.
- Provide clear status visibility for reconciliation and audit purposes.
- Ensure data consistency between systems.

4. API Overview

Authentication

- **Scheme:** Basic Authentication
- Example header:

Authorization: Basic <base64(username:password)>

5. Endpoint Details

URL: <https://paygatewayuat.nssfug.org/>

POST api/Transaction/standing_order_callback

Headers:

Header	Value
Content-Type	application/json
Authorization	Basic {token}

6. Request Format (from Partner)

Request Body (JSON):

```
{
  "standingOrderIdentifier": "000000000150",
  "bankStatus": "SUCCESS",
  "bankStatusCode": "200",
  "additionalInformation": "SUCCESS"
}
```

Request Fields

Field	Type	Description
standingOrderIdentifier	string	The unique identifier for the standing order request
bankStatus	string	SUCCESS or FAILED
bankStatusCode	string	Status code from the partner, typically 200 (Successful setup) or 100 (Failed set up)
additionalInformation	string	Additional details from the partner (optional)

7. Response Format

Success Response

```
{
  "StatusCode": "200",
  "StatusDescription": "Success"
}
```

Failure Response

```
{
  "StatusCode": "404",
  "StatusDescription": "Transaction not found"
}
```

Status Code	Description
200	Callback received successfully
404	Standing order not found / invalid reference
